

Kelton Angle and Eccentric faceplates Used in Combination

The true potential of these two accessories is revealed when they are used together. The external thread on the boss of the plate allows it to be screwed directly into the Eccentric Faceplate (as shown in the photos below).

The Angle Faceplate in conjunction with the Eccentric Faceplate can be used to produce many shapes including off-centered bowls with differential wall heights, hollow forms with angular projecting necks and non-circular dishes with differential wall height. Numerous other possibilities await the imaginative and resourceful turner.
